

External Data Connector for SharePoint

External DB data → SharePoint Items

The **External Data Connector for SharePoint** connects to external databases allowing authenticated SharePoint users to access external DBs, identify the required tables and import them into SharePoint as Items.

Allows you to use SharePoint's collaborative features to share vital DB data between the desired groups and users and update it as necessary. Works with SharePoint 2010, SharePoint 2013 and SharePoint online in Office 365.

With **External Data Connector**, You can:

- Add **imported tables from separate sources** as Items in SharePoint **Lists**
- Import data from SQL Server, Oracle, MS Exchange Server & ODBC supported clients along with file formats like XLSX, CSV, MDB, etc.
- Use SharePoint to **host, store** and **share** important DB objects **from different sources**
- **Update** and store these imported tables as **different versions** for analysis
- **Sync** SharePoint metadata with source DB metadata
- **Copy** imported Items to Library to view and review
- **Compare** and **analyze** the imported DB tables in SharePoint
- **Share** data sourced from different database in a **secure environment**
