

Active Directory Change Tracker

Change Auditing, Tracking and Analysis for Active Directory

At a Glance

* No Agent installation. Works off your desktop. Installing and configuring the tool takes just a few minutes.

* Track and audit all changes made to Active Directory, across your enterprise. Track changes to critical OUs and GPOs.

* Analyze and determine the integrity of the changes (whether the right changes were made by the right personnel).

* Track changes with or without using Active Directory's native auditing capabilities.

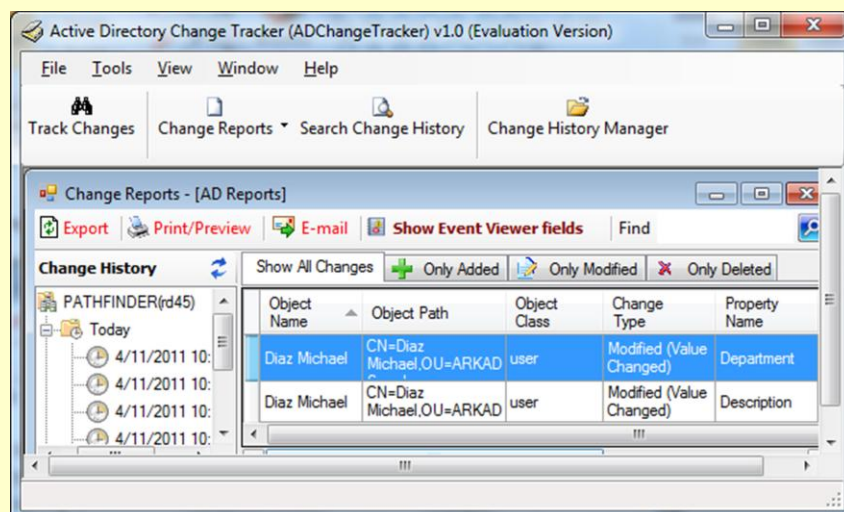

* Efficient data collection. Only incremental Change data is collected during each run. Creates almost no additional load on the domain controllers.

Capture and maintain a Change History of all critical changes to your Active Directory and GPOs.

Why do you need it

Active Directory has become the backbone of an enterprise's information infrastructure. The sheer size and overwhelming complexity of Active Directory has made its management burdensome. Change Management has become essential for Compliance, regulation and internal administration needs in order to answer important questions about Security and the health of your network. Active Directory Change Tracker is Vyapin's solution to track and audit all changes to your Active Directory.

Active Directory Change Tracker can work with or without your AD's native auditing. Without enabling your AD's native auditing, you can still track changes to your AD by using our solution's efficient method of incremental Change data collection and recording what exactly changed and where it changed, to a database. If you decide to use your native AD auditing, it is even more powerful to use our solution to first **detect** these changes, cut through the clutter and noise in your Security event logs from all your domain controllers (since event log data is not replicated) and extract only those relevant records that contain those valuable information on who made the changes and when the changes happened. Additionally, you will have the ability to store the entire Event log record along with the changes for your future reference. Active Directory Change Tracker is your most efficient way to track and maintain a long-term history of all changes made to your Active Directory.

At a Glance (Contd.)

* Capture audit records from Event logs by using native Active Directory auditing and combine them with the tool to produce reports on who made the change and when the change occurred.

* Create and maintain a Change History in a SQL database along with Event log Audit records. Helps you store several years of Change data for compliance and regulation purposes.

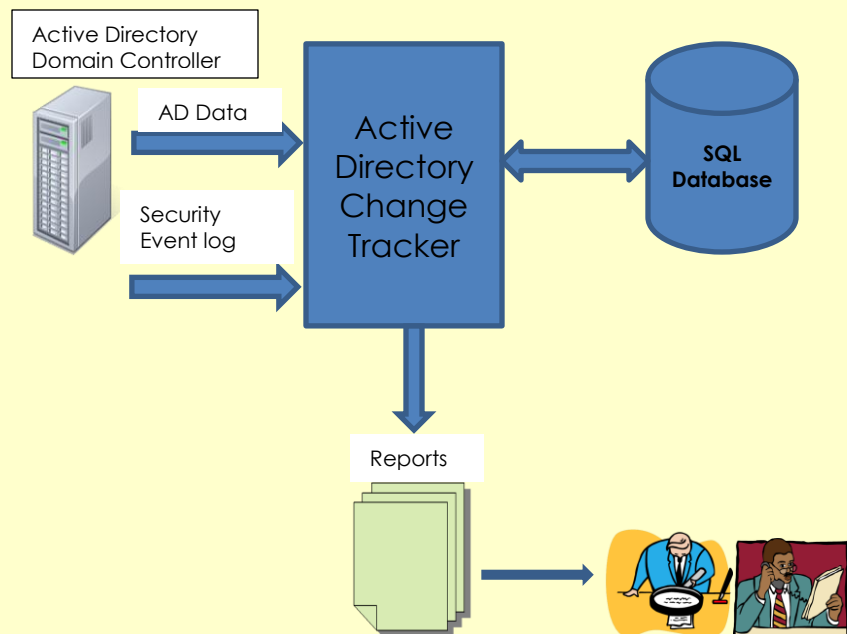

* Selectively track only important containers or OUs.

* Search your entire Change History using powerful Search criteria – search for additions, deletions and modifications on specific users, groups, OUs, object property values etc.

* Schedule your reports for immediate email notification as soon as changes are detected.

How does it work

Active Directory Change Tracker tracks, analyzes and reports all changes made to your Active Directory configuration. The tool keeps track of changes made to your AD by periodically collecting only the changed data, including what exactly changed, along with old and new values, where the change occurred, who made the change and when the change was made. Active Directory Change tracker records and maintains the entire history of all tracked changes along with the relevant Security Event log data in a SQL server database for future reference and analysis.

A powerful search tool helps you analyze all past changes on any predefined search criteria. For example, you may search for all object deletions in your AD in the last one month or you may search for object values that got changed or you may search for rights that changed for an Administrator. You may also search for specific users, groups or OUs on which changes were made during a particular time period. Changes can be selectively tracked (such as only OUs or specific containers) and the built-in email notification helps you detect changes straight from your mailbox.
