

Office 365 Export

Release Notes

Last Updated: March 2018

Version 5.0

- Included support for Multi Factor Authentication enabled Office 365 tenant in the application.
- Removed support for x86 machine architecture and MDB data storage.

Version 4.0.4

- Removed the support for task name with Unicode characters, since it causes issues when the schedule task runs.

Version 4.0.3

- Fixed an issue related to non-English mail attachments.
- Fixed an issue in handling the MAPI Profiles when handling network connectivity issues.
- Improved performance when exporting multiple attachments in a mail item.

Version 4.0.2

- Added support for exporting mail items of sharing invitations, Group mailbox requests and Fax items type in PST export feature.
- Fixed certain issues, which cause the application crash when Sender does not contain the associated e-mail address.

- Fixed an issue in schedule task manager that caused the task to fail to run, if the task name consists of additional spaces (ex: task name).
- Removed the support for task name with a dot (.), since it causes issues in schedule task creation.

Version 4.0.1

- Performance enhancement in the PST export feature on exporting content from Mailbox folders and public folders.
- Added an Export statistics window in the PST Export feature, to show the number of folders, items that get exported in each processed folder.
- Fixed an issue in running, editing and deleting a task in Task Manager, if the task name includes a dot (.)

Version 4.0

- **Introduced** a new database option called **Application database** which doesn't require any prerequisite for data storage.
- Added a new feature called **OneDrive Export** to Export / Archive OneDrive content for the selected users.
- Modified the PST Export feature. PST Export feature doesn't require an Outlook Profile anymore.

Version 3.2.1

- Fixed an issue in Copy Task and in User Picker when using the 'Users who have Admin Roles' option under multiple domains case.

Version 3.2

- Fixed an issue in recipient picker to load users from multiple domains in Office 365.

Version 3.1

- Modified PST Export feature to grant permission on mailboxes to view their contents and remove it after export. Also, supports individual folder selection now.

Version 3.0.1

- Fixed to correct the evaluation license dialog text.

Version 3.0

- Included the following new features:
 1. Export Mailboxes and Public Folders to PST – To export mailboxes, online archive and public folders from your Office 365 to file system.
 2. Export Mail Items to another mailbox – To export mail items from one mailbox to another.
 3. Export Public folders to another mailbox – To export items in Public Folder to another mailbox.

Version 2.1

- Fixed installation issue for 64-bit windows OS.

Version 2.0

- Incremental export feature for exporting mails created / modified after the last export time.

Version 1.0

First version of Office 365 Export module that helps the user to extract and export mails from personal message folders and public folders. It has various features as stated below:

- Selectively export contents of Public Folders and mailbox folders (Inbox, Drafts, Sent Items, Deleted Items, Contacts, Tasks, Calendar, Journal and custom folders).
- Provision to optionally export sub-folders.
- Perform a full export of contents with optional search conditions.
- Perform incremental export of contents which are newly created or modified since last export.

- Conditional export of contents based on Subject, Body, To, CC, Headers.
- Export the associated attachments in separate folders.
- Schedule the export process at the desired time intervals.
